Application No. 10/617,821   Docket No.: 2450-0520P
Amendment June 19, 2007
Reply to Office Action of March 19, 2007

AMENDMENTS TO THE CLAIMS

1. (Currently amended) A parent-children interactive intelligent management system, which is applied to use and manage household computers, for managing computer use authorization, time and operating system functions by simple operation, comprising:

a computer device having an operating ~~systems~~ system loaded therein ~~to manage and add the loaded parent-children interactive intelligent management system~~; and

a reading device connecting to the computer device for reading memory devices including a manager memory device and a user memory device; ~~and~~

~~a memory device insertable into the reading device;~~

wherein the computer device is empowered to perform settings of user authorization, time authorization or ~~and use operating systems~~ function authorization for the user memory device by inserting the manager memory device ~~on data in the memory device after the memory device has been inserted~~ into the reading device to facilitate managing computer device ~~use conditions of users~~ usage.

2. (Original) The parent-children interactive intelligent management system of claim 1, wherein the computer device is a desktop computer.

3. (Original) The parent-children interactive intelligent management system of claim 1, wherein the computer device is a notebook computer.

4

4. (Original) The parent-children interactive intelligent management system of claim 1, wherein the reading device is a card reader.

5. (Currently amended) The parent-children interactive intelligent management system of claim 1, wherein the memory device is selectively an <u>integrated circuit (IC)</u> IC card or a diskette.

6. (Currently amended) The parent-children interactive intelligent management system of claim 1, wherein after the system has been initialized and a manager <u>memory device</u> card is inserted, the computer device displays a picture for entering a manager password, the <u>manager memory device</u> card is locked after the password has been mistakenly entered three times.

7. (Currently amended) The parent-children interactive intelligent management system of claim 6, wherein the computer device automatically displays an account number for each insertion of the <u>memory device</u>card.

8. (Currently amended) The parent-children interactive intelligent management system of claim 6, wherein the system setting also is permitted to unlock the <u>memory device</u> card after the password has been mistakenly entered three times.

9. (Currently amended) The parent-children interactive intelligent management system of claim 1, wherein <u>the function authorization can be</u> functions of the parent children interactive

5   KM/

~~intelligent management system include at least~~ function setting, card setting, record inquiry,

advanced setting ~~and~~ or system descriptions.

10. (Withdrawn) A parent-children interactive intelligent management system for

managing program execution system setting methods of computer internal systems,

comprising:

   a. during software installation software automatically add preset manager and user

      account numbers and passwords into a control station;

   b. entering the parent-children intelligent management system when input password

      (with the account number shown automatically) is corrected, managers being permitted to

      execute functions of the parent-children intelligent management system; and

   c. completing program execution system setting after the aforesaid functions have

      been executed;

11. (Withdrawn) A parent-children interactive intelligent management system including a

method to alter card authorization setting, the method comprising:

   a. inserting a card, entering passwords, and entering a manager system;

   b. inserting a manager card into a reading device, processing alteration of data in the

      manager card and user cards, and settings of manager and user account numbers and

      passwords to complete setting of the manager card; and

6   KM/

   c. inserting a user card, processing alteration of user card use authorization, and settings of use time period, use time for each insertion of the card each day, use time frame in one week and alert minutes prior to use time expiration.

12. (Withdrawn) A parent-children interactive intelligent management system including a method to manage identification for logging on system by cards, the method comprising:

   a. inserting a card to determine a user or a manager by a keyword in the card before the manager or the user logs on;

   b. determining the manager when a manager card is identified, entering a first manager account number and password when the first manager is determined, entering a manager system, completing use of the manager system, the manager logging off the system and withdrawing the card; and

   c. determining a first user when a user card is identified by the system based on the keyword of the card, entering a first user account number and password, entering a user system, completing use of the user system, the user logging off the system when use time expires and withdrawing the user card.

13. (New) A parent-children interactive system comprising:

   a computer device having an operation system; and

   a reading device connecting to the computer device for reading a manager memory device used by a parent and a user memory device used by a child;

KM/

wherein when the manager memory device is inserted into the reading device, the computer usage authorization for the user memory device used by the child is changeable.

14. (New) The parent-children interactive system of claim 13, wherein computer usage authorization is user authorization, time authorization or computer function authorization.

15. (New) The parent-children interactive system of claim 14, wherein the computer usage authorization is changed by changing the setting in the computer device.

16. (New) The parent-children interactive system of claim 14, wherein the computer usage authorization is changed by changing the setting in the user memory device connected to the reading device.

17. (New) The parent-children interactive system of claim 14, wherein the computer usage information of the user memory device can be obtained when the manager memory device inserts into the reading device.

18. (New) The parent-children interactive system of claim 17, wherein the computer usage information is usage frequency, usage time, or usage duration.
